Phishing Awareness Training

Ifunanya Promise Adinde | CodeAlpha internship

How to Recognize Phishing Emails:

1. Sender address doesn’t match the company name.
2. Urgent or Threatening language such as “Act within 24hrs”.
3. Generic greetings like “Dear Customer”.
4. Unexpected attachments, especially .zip or .exe files.
5. Requests for passwords, pins, or payment.
6. Links that don’t match where they say they go.

How to Recognize a Fake Website:

1. The address is misspelled or uses extra words.
2. The address starts with http instead of https, or shows a padlock warning.
3. The sites asks for information it shouldn’t ask such as your full card number or password.
4. The web address doesn’t match the company you expected.
5. It push you to download something or call a number right away.

What is Social Engineering?

Social engineering is tricking people into giving out information or access, instead of breaking into computers with code.

Attackers do this by pretending to be someone you trust, such as a bank, your IT department, or a delivery company. They create urgency or fear so you act before you think. The attack works on people’s habits, like wanting to help or wanting to fix a problem quickly.

Best Practice and Tips:

1. Don’t click links in unexpected messages.
2. Turn on two-factor authentication.
3. Type website addresses yourself.
4. Never share passwords or your PINs.
5. Report suspicious emails to IT or the security team.

Real-World Examples:

In 2013 to 2015, attackers tricked google and facebook out of about $100 million with fake invoices.

Lesson: check unusual payment request with the person or company through a number you already know.

Quick Quiz?

1. Email asking you to login through a link in the message is it safe to trust? Answer: No

2. Should you share your password if someone calls claiming to be from IT? Answer: No
